MDF MODULE DOCUMENTATION

mdf_skeleton module describing basic mdf structure and methods Created on Thu Sept 24 2015

1.1 Platform and python version

With Unix and Windows for python 2.6+ and 3.2+

Author Aymeric Rateau

1.2 Dependencies

- Python >2.6, >3.2 http://www.python.org
- Numpy >1.6 http://numpy.scipy.org

1.3 mdf module

 ${\bf class} \; {\tt mdf.compressed_data}$

Methods

compression(a)

data compression method

Parameters a: numpy array

data to be compresses

decompression()

data decompression

 ${\bf class} \ {\tt mdf_skeleton} \ ({\it fileName=None}, \ {\it channelList=None}, \ {\it convertAfterRead=True}, \ {\it filterChannel-Names=False}, {\it noDataLoading=False}, {\it compression=False})$

Bases: dict

Methods

```
MDFVersionNumber
add_channel (dataGroup, channel_name, data, master_channel, master_type=1, unit='', descrip-
                tion='', conversion=None, info=None, compression=False)
     adds channel to mdf dict.
         Parameters dataGroup: int
               dataGroup number. Is appended to master name for non unique channel names
             channel name: str
               channel name
             data: numpy array
               numpy array of channel's data
             master_channel: str
               master channel name
             master_type: int, optional
               master channel type: 0=None, 1=Time, 2=Angle, 3=Distance, 4=index
             unit: str, optional
               unit description
             description: str, optional
               channel description
             conversion: info class, optional
               conversion description from info class
             info: info class for CNBlock, optional
               used for CABlock axis creation and channel conversion
             compression: bool
               flag to ask for channel data compression
add_metadata (author='', organisation='', project='', subject='', comment='', date='', time='')
     adds basic metadata to mdf class
         Parameters author: str
               author of file
             organisation: str
               organisation of author
             project : str
             subject: str
             comment : str
             date: str
             time: str
convertAfterRead
```

convert_tables copy() copy a mdf class fid fileName file metadata filterChannelNames getChannel (channelName) Extract channel dict from mdf structure Parameters channelName: str channel name Returns channel dictionnary containing data, description, unit, etc. getChannelConversion(channelName) Extract channel conversion dict from mdf structure Parameters channelName: str channel name Returns channel conversion dict getChannelDesc (channelName) Extract channel description information from mdf structure Parameters channelName: str channel name **Returns** channel description string getChannelMaster(channelName) Extract channel master name from mdf structure Parameters channelName: str channel name **Returns** channel master name string getChannelMasterType (channelName) Extract channel master type information from mdf structure Parameters channelName: str channel name Returns channel mater type integer getChannelUnit (channelName) Returns channel unit string Implemented for a future integration of pint

Parameters channelName: str

unit string description

channel name

Returns str

1.3. mdf module 5

```
info
```

masterChannelList

multiProc

remove_channel (channel_name)

removes channel from mdf dict.

Parameters channel name: str

channel name

Returns value of mdf dict key=channel_name

remove_channel_conversion(channelName)

removes conversion key from mdf channel dict.

Parameters channelName: str

channel name

Returns removed value from dict

rename_channel (channelName, newname)

Modifies name of channel

Parameters channelName: str

channel name

newname: str

new channel name

setChannelAttachment (channelName, attachment)

Modifies channel attachment

Parameters channelName: str

channel name

attachment

channel attachment

 $\verb§setChannelConversion (channelName, conversion)$

Modifies conversion dict of channel

Parameters channelName: str

channel name

conversion : dict

conversion dictionnary

setChannelData(channelName, data, compression=False)

Modifies data of channel

Parameters channelName: str

channel name

data: numpy array

channel data

compression: bool or str

trigger for data compression

setChannelDesc (channelName, desc)

Modifies description of channel

Parameters channelName: str

channel name

desc : str

channel description

setChannelMaster (channelName, master)

Modifies channel master name

Parameters channelName: str

channel name

master: str

master channel name

setChannelMasterType (channelName, masterType)

Modifies master channel type

Parameters channelName: str

channel name

masterType: int

master channel type

setChannelUnit (channelName, unit)

Modifies unit of channel

Parameters channelName: str

channel name

unit: str

channel unit

zipfile

1.3. mdf module 7

MDFREADER MODULE DOCUMENTATION

Measured Data Format file reader main module

2.1 Platform and python version

With Unix and Windows for python 2.6+ and 3.2+

Author Aymeric Rateau

Created on Sun Oct 10 12:57:28 2010

2.2 Dependencies

- Python >2.6, >3.2 http://www.python.org
- Numpy >1.6 http://numpy.scipy.org
- Sympy to convert channels with formula
- bitarray for not byte aligned data parsing
- Matplotlib >1.0 http://matplotlib.sourceforge.net
- NetCDF
- h5py for the HDF5 export
- xlwt for the excel export (not existing for python3)
- openpyxl for the excel 2007 export
- scipy for the Matlab file conversion
- · zlib to uncompress data block if needed

2.3 Attributes

PythonVersion [float] Python version currently running, needed for compatibility of both python 2.6+ and 3.2+

2.4 mdfreader module

Notes

mdf class is a nested dict Channel name is the primary dict key of mdf class At a higher level, each channel includes the following keys:

```
'data': containing vector of data (numpy)
'unit': unit (string)
'master': master channel of channel (time, crank angle, etc.)
'description': Description of channel
```

•'conversion': mdfinfo nested dict for CCBlock. Exist if channel not converted, used to convert with getChannelData method

Examples

```
>>> import mdfreader
>>> yop=mdfreader.mdf('NameOfFile')
>>> yop.keys() # list channels names
# list channels grouped by raster or master channel
>>> yop.masterChannelList
>>> yop.plot('channelName') or yop.plot({'channel1','channel2'})
>>> yop.resample(0.1) or yop.resample(channelName='master3')
>>> yop.exportoCSV(sampling=0.01)
>>> yop.exportNetCDF()
>>> yop.exporttoHDF5()
>>> yop.exporttoMatlab()
>>> yop.exporttoExcel()
>>> yop.exporttoXlsx()
>>> yop.convertToPandas() # converts data groups into pandas dataframes
>>> yop.write() # writes mdf file
# drops all the channels except the one in argument
>>> yop.keepChannels({'channel1','channel2','channel3'})
>>> yop.getChannelData('channelName') # returns channel numpy array
```

Attributes

fileName	(str) file name
MDFVer-	(int) mdf file version number
sionNum-	
ber	
master-	(dict) Represents data structure: a key per master channel with corresponding value
Channel-	containing a list of channels One key or master channel represents then a data group having
List	same sampling interval.
multiProc	(bool) Flag to request channel conversion multi processed for performance improvement.
	One thread per data group.
file_metadata	(dict) file metadata with minimum keys: author, organisation, project, subject, comment,
	time, date

Methods

convertAfterRead=True, filterChannelNames=False, noDataLoading=False, compression=False) write (fileName=None) getChannelData(channelName) convertAllChannel() getChannelData(channelName) converts all channel data according to CCBlock information getChannelUnit(channelName) getChannelUnit(channelName) getChannelUnit(channelName) getChannelUnit(channelName) getChannelUnit(channelName) getChannelUnit(channelName) plot (channels) Resample (samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) Exports mdf data into CSV file exportToNetCDF(filename = None, sampling = None) Exports mdf data into netcdf file exportToHDF5(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) keepChannels(channelList) keep only list of channels and removes the other channels	read(fileName = None, multiProc = False, channelList=None,	reads mdf file version 3.x
compression=False) write (fileName=None) getChannelData (channelName) convertAllChannel() getChannelIData (channelName) getChannelUnit(channelName) getChannelUnit(channelName) getChannelUnit(channelName) plot (channels with Matplotlib resample(samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) exportToNetCDF(filename = None, sampling = None) exportToHDF5(filename = None, sampling = None) exportToMatlab(filename = None) exportToMatlab(filename = None) Exports mdf class data structure into hdf5 file exportToExcel(filename = None) exportToExcel(filename = None) Exports mdf class data structure into Matlab file exportToXlsx(filename = None) Exports mdf data into excel 95 to 2003 file exportToAlsx(filename=None) converts mdf data structure into pandas data frame(s) keepChannels(channelList) keep sonly list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		
write (fileName=None) getChannelData(channelName) convertAllChannel() getChannelUnit(channelName) getChannelUnit(channelName) getChannelUnit(channelName) getChannelUnit(channelName) getChannelS) plot channels with Matplotlib resample(samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) exportToNetCDF(filename = None, sampling = None) exportToMatlab(filename = None, sampling = None) exportToMatlab(filename = None) exportToMatlab(filename = None) exportToExcel(filename = None) exportToExcel(filename = None) exportToXlsx(filename = None) exportToAlsx(filename = None) exportToA		
convertAllChannel() converts all channel data according to CCBlock information getChannelUnit(channelName) getChannelS) plot channels with Matplottib resample(samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) Exports mdf data into CSV file exportToNetCDF(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	write(fileName=None)	writes simple mdf file
convertAllChannel() converts all channel data according to CCBlock information getChannelUnit(channelName) getChannelS) plot channels with Matplottib resample(samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) Exports mdf data into CSV file exportToNetCDF(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	getChannelData(channelName)	returns channel numpy array
information getChannelUnit(channelName) returns channel unit plot(channels) Plot channels with Matplotlib resample(samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) exportToNetCDF(filename = None, sampling = None) exportToHDF5(filename = None, sampling = None) exportToMatlab(filename = None, sampling = None) Exports mdf data into netcdf file exportToMatlab(filename = None) Exports mdf class data structure into hdf5 file exportToExcel(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	convertAllChannel()	
getChannelUnit(channelName) plot (channels) Plot channels with Matplotlib resample(samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) exportToNetCDF(filename = None, sampling = None) exportToHDF5(filename = None, sampling = None) exportToMatlab(filename = None, sampling = None) exportToMatlab(filename = None) exportToExcel(filename = None) exportToExcel(filename = None) exportToXlsx(filename=None) exportToXlsx(filename=None) exportToPandas(sampling=None) exportToPandas(sampling=None) convert ToPandas(sampling=None) keepChannels(channelList) mergeMdf(mdfClass): returns channels unit Meturns channel unit Plot channels with Matplotlib Resamples all data groups Exports mdf data into CSV file file Exports mdf class data structure into Matlab file Exports mdf data into excel 2007 and 2010 file convert ToPandas(sampling=None) keepS only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		according to CCBlock
plot (channels) Plot channels with Matplotlib resample (samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) Exports mdf data into CSV file exportToNetCDF(filename = None, sampling = None) Exports mdf class data into netcdf file exportToHDF5(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		information
Matplotlib resample(samplingTime = 0.1, masterChannel=None) Resamples all data groups exportToCSV(filename = None, sampling = 0.1) Exports mdf data into CSV file exportToNetCDF(filename = None, sampling = None) Exports mdf data into netcdf file exportToHDF5(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	getChannelUnit(channelName)	returns channel unit
resample(samplingTime = 0.1, masterChannel=None) exportToCSV(filename = None, sampling = 0.1) exportToNetCDF(filename = None, sampling = None) exportToNetCDF(filename = None, sampling = None) exportToHDF5(filename = None, sampling = None) exportToMatlab(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	plot(channels)	Plot channels with
exportToCSV(filename = None, sampling = 0.1) Exports mdf data into CSV file exportToNetCDF(filename = None, sampling = None) Exports mdf data into netcdf file exportToHDF5(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		Matplotlib
file exportToNetCDF(filename = None, sampling = None) Exports mdf data into netcdf file exportToHDF5(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	resample(samplingTime = 0.1, masterChannel=None)	Resamples all data groups
exportToNetCDF(filename = None, sampling = None) Exports mdf data into netcdf file exportToHDF5(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	exportToCSV(filename = None, sampling = 0.1)	Exports mdf data into CSV
file exportToHDF5(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		*****
exportToHDF5(filename = None, sampling = None) Exports mdf class data structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	exportToNetCDF(filename = None, sampling = None)	Exports mdf data into netcdf
structure into hdf5 file exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		*****
exportToMatlab(filename = None) Exports mdf class data structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	exportToHDF5(filename = None, sampling = None)	Exports mdf class data
structure into Matlab file exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		structure into hdf5 file
exportToExcel(filename = None) Exports mdf data into excel 95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	exportToMatlab(filename = None)	*
95 to 2003 file exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		structure into Matlab file
exportToXlsx(filename=None) Exports mdf data into excel 2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	exportToExcel(filename = None)	Exports mdf data into excel
2007 and 2010 file convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		
convertToPandas(sampling=None) converts mdf data structure into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	exportToXlsx(filename=None)	
into pandas dataframe(s) keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		
keepChannels(channelList) keeps only list of channels and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf	convertToPandas(sampling=None)	
and removes the other channels mergeMdf(mdfClass): Merges data of 2 mdf		
channels mergeMdf(mdfClass): Merges data of 2 mdf	keepChannels(channelList)	1 -
mergeMdf(mdfClass): Merges data of 2 mdf		
		*
classes	mergeMdf(mdfClass):	
		classes

allPlot()

convertAllChannel()

Converts all channels from raw data to converted data according to CCBlock information Converted data will take more memory.

2.4. mdfreader module 11

```
convertToPandas (sampling=None)
```

converts mdf data structure into pandas dataframe(s)

Parameters sampling: float, optional

resampling interval

Notes

One pandas dataframe is converted per data group Not adapted yet for mdf4 as it considers only time master channels

```
copy()
```

copy a mdf class

cut (begin=None, end=None)

Cut data

Parameters begin: float

beginning value in master channel from which to start cutting in all channels

end: float

ending value in master channel from which to start cutting in all channels

Notes

Use this method if whole data in mdf are using same physical or type of master channel (for instance time).

```
exportToCSV (filename=None, sampling=None)
```

Exports mdf data into CSV file

Parameters filename: str, optional

file name. If no name defined, it will use original mdf name and path

sampling: float, optional

sampling interval. None by default

Notes

Data saved in CSV fille be automatically resampled as it is difficult to save in this format data not sharing same master channel Warning: this can be slow for big data, CSV is text format after all

```
exportToExcel (filename=None)
```

Exports mdf data into excel 95 to 2003 file

Parameters filename: str, optional

file name. If no name defined, it will use original mdf name and path

Notes

xlwt is not fast even for small files, consider other binary formats like HDF5 or Matlab If there are more than 256 channels, data will be saved over different worksheets Also Excel 2003 is becoming rare these days, prefer using exportToXlsx

exportToHDF5 (filename=None, sampling=None)

Exports mdf class data structure into hdf5 file

Parameters filename: str, optional

file name. If no name defined, it will use original mdf name and path

sampling: float, optional sampling interval.

Notes

The maximum attributes will be stored Data structure will be similar has it is in masterChannelList attribute

exportToMatlab (filename=None)

Export mdf data into Matlab file format 5, tentatively compressed

Parameters filename: str, optional

file name. If no name defined, it will use original mdf name and path

Notes

This method will dump all data into Matlab file but you will loose below information: - unit and descriptions of channel - data structure, what is corresponding master channel to a channel.

Channels might have then different lengths

exportToNetCDF (filename=None, sampling=None)

Exports mdf data into netcdf file

Parameters filename: str, optional

file name. If no name defined, it will use original mdf name and path

sampling: float, optional

sampling interval.

exportToXlsx (filename=None)

Exports mdf data into excel 2007 and 2010 file

Parameters filename: str, optional

file name. If no name defined, it will use original mdf name and path

Notes

It is recommended to export resampled data for performances

getChannelData(channelName)

Return channel numpy array

Parameters channelName: str

channel name

2.4. mdfreader module 13

Notes

This method is the safest to get channel data as numpy array from 'data' dict key might contain raw data

keepChannels (channelList)

keeps only list of channels and removes the other channels

Parameters channelList: list of str

list of channel names

mergeMdf (mdfClass)

Merges data of 2 mdf classes

Parameters mdfClass: mdf

mdf class instance to be merge with self

Notes

both classes must have been resampled, otherwise, impossible to know master channel to match create union of both channel lists and fill with Nan for unknown sections in channels

plot (channels)

Plot channels with Matplotlib

Parameters channels: str or list of str

channel name or list of channel names

Notes

Channel description and unit will be tentatively displayed with axis labels

Parameters fileName: str, optional

file name

multiProc: bool

flag to activate multiprocessing of channel data conversion

channelList: list of str, optional

list of channel names to be read If you use channelList, reading might be much slower but it will save you memory. Can be used to read big files

convertAfterRead: bool, optional

flag to convert channel after read, True by default If you use convertAfterRead by setting it to false, all data from channels will be kept raw, no conversion applied. If many float are stored in file, you can gain from 3 to 4 times memory footprint To calculate value from channel, you can then use method .getChannelData()

filterChannelNames: bool, optional

flag to filter long channel names from its module names separated by '.'

noDataLoading: bool, optional

Flag to read only file info but no data to have minimum memory use

compression: bool or str, optional

To compress data in memory using blosc or bcolz, takes cpu time if compression = int(1 to 9), uses bcolz for compression if compression = 'blosc', uses blosc for compression Choice given, efficiency depends of data

Notes

If you keep convertAfterRead to true, you can set attribute mdf.multiProc to activate channel conversion in multiprocessing. Gain in reading time can be around 30% if file is big and using a lot of float channels

resample (samplingTime=None, masterChannel=None)

Resamples all data groups into one data group having defined sampling interval or sharing same master channel

Parameters samplingTime: float, optional

resampling interval, None by default. If None, will merge all datagroups into a unique datagroup having the highest sampling rate from all datagroups

or

masterChannel: str, optional

master channel name to be used for all channels

Notes

- 1. resampling is relatively safe for mdf3 as it contains only time series. However, mdf4 can contain also distance, angle, etc. It might make not sense to apply one resampling to several data groups that do not share same kind of master channel (like time resampling to distance or angle data groups) If several kind of data groups are used, you should better use pandas to resample
- 2. resampling will convert all your channels so be careful for big files and memory consumption

write (fileName=None)

Writes simple mdf file, same format as originally read, default is 4.x

Parameters fileName: str, optional

Name of file If file name is not input, written file name will be the one read with appended '_new' string before extension

Notes

All channels will be converted, so size might be bigger than original file

class mdfreader.mdfinfo (fileName=None, filterChannelNames=False, fid=None, minimal=0)
 Bases: dict

2.4. mdfreader module 15

Methods

fid

fileName

filterChannelNames

listChannels (fileName=None)

Read MDF file blocks and returns a list of contained channels

Parameters fileName: string

file name

Returns nameList: list of string

list of channel names

mdfversion

 $\verb"readinfo" (fileName=None, fid=None, minimal=0)$

Reads MDF file and extracts its complete structure

Parameters fileName: str, optional

file name. If not input, uses fileName attribute

fid: file identifier, optional

minimal: int

0 will load every metadata 1 will load DG, CG, CN and CC 2 will load only DG

zipfile

CHAPTER

THREE

MDF3READER MODULE DOCUMENTATION

Measured Data Format file reader module for version 3.x

3.1 Platform and python version

With Unix and Windows for python 2.6+ and 3.2+

Author Aymeric Rateau

Created on Sun Oct 10 12:57:28 2010

3.2 Dependencies

- Python >2.6, >3.2 http://www.python.org
- Numpy >1.6 http://numpy.scipy.org
- Sympy to convert channels with formula

3.3 Attributes

PythonVersion [float] Python version currently running, needed for compatibility of both python 2.6+ and 3.2+

3.4 mdf3reader module

class mdf3reader.DATA (fid, pointer)

Bases: dict

DATA class is organizing record classes itself made of channel. This class inherits from dict. Keys are corresponding to channel group recordID. A DATA class corresponds to a data block, a dict of record classes (one per channel group). Each record class contains a list of channel class representing the structure of channel record.

Attributes

fid	(io.open) file identifier
pointerToData	(int) position of Data block in mdf file
BlockLength	(int) total size of data block

Methods

addRecord(record)	Adds a new record in DATA class dict
read(channelSet)	Reads data block
loadSorted(record, nameList=None)	Reads sorted data block from record definition
loadUnSorted(nameList=None)	Reads unsorted data block, not yet implemented

addRecord (record)

Adds a new record in DATA class dict

Parameters record class

channel group definition listing record channel classes

loadSorted (record, nameList=None)

Reads sorted data block from record definition

Parameters record class

channel group definition listing record channel classes

channelSet: set of str, optional

list of channel names

Returns numpy recarray of data

loadUnSorted(nameList=None)

Reads unsorted data block from record definition

Parameters record class

channel group definition listing record channel classes

channelSet: set of str, optional

list of channel names

Returns numpy recarray of data

read (channelSet)

Reads data block

Parameters channelSet: set of str, optional

list of channel names

mdf3reader.expConv(data, conv)

apply exponential conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

 $\verb|mdf3reader.formulaConv| (\textit{data}, \textit{conv})|$

apply formula conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

Notes

Requires sympy module

mdf3reader.linearConv (data, conv) apply linear conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

mdf3reader.logConv (*data*, *conv*) apply logarithmic conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

 ${\bf class} \ {\tt mdf3reader.mdf3} \ ({\it fileName=None, channel List=None, convert After Read=True, filter None, convert After Read=True, filter Channel List=No$

Names=False, noDataLoading=False, compression=False)

Bases: mdf.mdf_skeleton
mdf file version 3.0 to 3.3 class

Attributes

fileName	(str) file name
MDFVer-	(int) mdf file version number
sionNum-	
ber	
master-	(dict) Represents data structure: a key per master channel with corresponding value
Channel-	containing a list of channels One key or master channel represents then a data group having
List	same sampling interval.
multiProc	(bool) Flag to request channel conversion multi processed for performance improvement.
	One thread per data group.
con-	(bool) flag to convert raw data to physical just after read
vertAfter-	
Read	
filterChan-	(bool) flag to filter long channel names from its module names separated by '.'
nelNames	
file_metadata	(dict) file metadata with minimum keys: author, organisation, project, subject, comment,
	time, date

Methods

read3(fileName=None, info=None, multiProc=False,	Reads mdf 3.x file data and stores it in dict
channelList=None, convertAfterRead=True)	
_getChannelData3(channelName)	Returns channel numpy array
_convertChannel3(channelName)	converts specific channel from raw to physical
	data according to CCBlock information
_convertAllChannel3()	Converts all channels from raw data to converted
	data according to CCBlock information
write3(fileName=None)	Writes simple mdf 3.3 file

read3 (fileName=None, info=None, multiProc=False, channelList=None, convertAfterRead=True, filterChannelNames=False, compression=False)
Reads mdf 3.x file data and stores it in dict

Parameters fileName: str, optional

file name

info: mdfinfo3.info3 class

info3 class containing all MDF Blocks

multiProc: bool

flag to activate multiprocessing of channel data conversion

channelList: list of str, optional

list of channel names to be read If you use channelList, reading might be much slower but it will save you memory. Can be used to read big files

convertAfterRead: bool, optional

flag to convert channel after read, True by default If you use convertAfterRead by setting it to false, all data from channels will be kept raw, no conversion applied. If many float are stored in file, you can gain from 3 to 4 times memory footprint To calculate value from channel, you can then use method .getChannelData()

compression: bool, optional

falg to activate data compression with blosc

write3 (fileName=None)

Writes simple mdf 3.3 file

Parameters fileName: str, optional

Name of file If file name is not input, written file name will be the one read with appended '_new' string before extension

Notes

All channels will be converted to physical data, so size might be bigger than original file

mdf3reader.polyConv (data, conv) apply polynomial conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

mdf3reader.rationalConv(data, conv)

apply rational conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

class mdf3reader.record (dataGroup, channelGroup)

Bases: list

record class lists Channel classes, it is representing a channel group

Attributes

CGrecordLength	(int) length of record from channel group block information in Byte
recordLength	(int) length of record from channels information in Byte
numberOfRecords	(int) number of records in data block
recordID	(int) recordID corresponding to channel group
recordIDnumber	(int) size of recordID
dataGroup	(int:) data group number
channelGroup	(int) channel group number
numpyDataRecordFormat	(list) list of numpy (dtype) for each channel
dataRecordName	(list) list of channel names used for recarray attribute definition
master	(dict) define name and number of master channel
recordToChannelMatch-	(dict) helps to identify nested bits in byte
ing	
channelNames	(set) channel names to be stored, useful for low memory consumption but
	slow
hiddenBytes	(Bool, False by default) flag in case of non declared channels in record
byte_aligned	(Bool, True by default) flag for byte aligned record

Methods

addChannel(info, channelNumber)	
loadInfo(info)	
readSortedRecord(fid, pointer, channelSet=None)	
readRecordBuf(buf, channelSet=None)	
readRecordBits(bita, channelSet=None)	
changeChannelName(channelName)	

addChannel (info, channelNumber)

add a channel in class

Parameters info: mdfinfo3.info3 class

channelNumber: int

channel number in mdfinfo3.info3 class

loadInfo(info)

gathers records related from info class

Parameters info: mdfinfo3.info3 class

readRecordBits (bita, channelSet=None)

read stream of record bits by bits in case of not aligned or hidden bytes

Parameters buf: stream

stream of bytes read in file

channelSet: Set of str, optional

list of channel to read

Returns rec: dict

returns dictionary of channel with its corresponding values

readRecordBuf (buf, channelSet=None)

read stream of record bytes

Parameters buf: stream

stream of bytes read in file

channelSet: Set of str, optional

list of channel to read

Returns rec: dict

returns dictionary of channel with its corresponding values

readSortedRecord (fid, pointer, channelSet=None)

reads record, only one channel group per datagroup

Parameters fid: float

file identifier

pointer

position in file of data block beginning

channelSet: Set of str, optional

list of channel to read

Returns rec: numpy recarray

contains a matrix of raw data in a recarray (attributes corresponding to channel name)

Notes

If channelSet is None, read data using numpy.core.records.fromfile that is rather quick. However, in case of large file, you can use channelSet to load only interesting channels or only one channel on demand, but be aware it might be much slower.

mdf3reader.tabConv(data, conv)

apply Tabular conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

mdf3reader.tabInterpConv(data, conv)

apply Tabular interpolation conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

mdf3reader.textRangeTableConv(data, conv)

apply text range table conversion to data

Parameters data: numpy 1D array

raw data to be converted to physical value

conv: mdfinfo3.info3 conversion block ('CCBlock') dict

Returns converted data to physical value

CHAPTER

FOUR

MDFINFO3 MODULE DOCUMENTATION

Measured Data Format blocks parser for version 3.x Created on Thu Dec 9 12:57:28 2014

4.1 Platform and python version

With Unix and Windows for python 2.6+ and 3.2+

Author Aymeric Rateau

4.2 Dependencies

- Python >2.6, >3.2 http://www.python.org
- Numpy >1.6 http://numpy.scipy.org

4.3 Attributes

Python Version [float] Python version currently running, needed for compatibility of both python 2.6+ and 3.2+

4.4 mdfinfo3 module

Methods

```
cleanDGinfo (dg) delete CN,CC and CG blocks related to data group

Parameters dg: int

data group number
```

fileName

```
filterChannelNames
```

listChannels3 (fileName=None, fid=None)

reads data, channel group and channel blocks to list channel names

Returns list of channel names

Attributes

```
fileName
                       (str) file name
     readCGBlock (fid, dg, minimal=0)
          read all CG blocks and relying CN & CC
              Parameters fid: float
                     file identifier
                  dg: int
                    datagroup number
                  channelSet: set
                     set of channel names to read
                  minimal: int
                    0 will load every metadata 1 will load DG, CG, CN and CC 2 will load only DG
     readinfo3 (fid, minimal=0)
          read all file blocks except data
              Parameters fid: float
                     file identifier
                  minimal: int
                    0 will load every metadata 1 will load DG, CG, CN and CC 2 will load only DG
mdfinfo3.read_cc_block (fid, pointer)
     channel conversion block reading
mdfinfo3.read_cg_block (fid, pointer)
     channel block reading
mdfinfo3.read_cn_block (fid, pointer)
     channel block reading
mdfinfo3.read_dg_block (fid, pointer)
     data group block reading
mdfinfo3.read_hd_block (fid, pointer, version=0)
     header block reading
mdfinfo3.read_tx_block (fid, pointer)
     reads text block
```

CHAPTER

FIVE

MDF4READER MODULE DOCUMENTATION

Measured Data Format file reader module for version 4.x.

5.1 Platform and python version

With Unix and Windows for python 2.6+ and 3.2+

Author Aymeric Rateau

Created on Thu Dec 10 12:57:28 2013

5.2 Dependencies

- Python >2.6, >3.2 http://www.python.org
- Numpy >1.6 http://numpy.scipy.org
- bitarray to parse bits in not aligned bytes
- Sympy to convert channels with formula if needed
- · zlib to uncompress data block if needed

5.3 Attributes

PythonVersion [float] Python version currently running, needed for compatibility of both python 2.6+ and 3.2+

5.4 mdf4reader module

class mdf4reader.DATA (fid, pointer)
 Bases: dict

Methods

addRecord (record)

Adds a new record in DATA class dict.

Parameters record class

```
channel group definition listing record channel classes
```

```
fid
```

load (*record*, *info*, *zip=None*, *nameList=None*, *sortedFlag=True*) Reads data block from record definition

Parameters record class

channel group definition listing record channel classes

zip: bool, optional

flag to track if data block is compressed

nameList: list of str, optional

list of channel names

Returns numpy recarray of data

pointerTodata

 $\verb"read" (channel Set, info, zip=None)"$

Reads data block

Parameters channelSet: set of str

set of channel names

zip: bool, optional

flag to track if data block is compressed

readRecord (recordID, info, buf, channelSet=None)

read record from a buffer

Parameters recordID: int

record identifier

buf: str

buffer of data from file to be converted to channel raw data

channelSet: set of str

setof channel names to be read

type

mdf4reader.DATABlock (record, info, parent_block, channelSet=None, sortedFlag=True)
DATABlock converts raw data into arrays

Parameters record: class

record class instance describing a channel group record

parent_block : class

MDFBlock class containing at least parent block header

channelSet: set of str, optional

defines set of channels to only read, can be slow but saves memory, for big files

sortedFlag: bool, optional

flag to know if data block is sorted (only one Channel Group in block) or unsorted (several Channel Groups identified by a recordID). As unsorted block can contain CG records in random order, block is processed iteratively, not in raw like sorted -> much slower reading

Returns a recarray containing the channels data

Notes

```
This function will read DTBlock, RDBlock, DZBlock (compressed), RDBlock (VLSD), sorted or unsorted
mdf4reader.append_field(rec, name, arr, numpy_dtype=None)
     append new field in a recarray
          Parameters rec: numpy recarray
              name: str
                  name of field to be appended
              arr: numpy array to be appended
              numpy_dtype : numpy dtype, optional
                  apply same dtype as arr by default but can be modified
          Returns numpy recarray appended
mdf4reader.change_field_name (arr, old_name, new_name)
     modifies name of field in a recarray
          Parameters arr: numpy recarray
              old_name: str
                  old field
              new_name: str
                  new field
          Returns numpy recarray with modified field name
mdf4reader.decompress_datablock(block, zip_type, zip_parameter, org_data_length)
     decompress datablock.
          Parameters block: bytes
                  raw data compressed
              zip_type : int
                  0 for non transposed, 1 for transposed data
              zip_parameter: int
                  first dimension of matrix to be transposed
              org_data_length: int
                  uncompressed data length
          Returns uncompressed raw data
mdf4reader.equalizeStringLength(buf)
```

Makes all strings in a list having same length by appending spaces strings.

Parameters buf: list of str

Returns list of str elements all having same length

mdf4reader.formulaConv(vect, formula)

apply formula conversion to data

Parameters vect : numpy 1D array

raw data to be converted to physical value

cc_val: mdfinfo4.info4 conversion block ('CCBlock') dict

Returns converted data to physical value

mdf4reader.linearConv(vect, cc_val)

apply linear conversion to data

Parameters vect: numpy 1D array

raw data to be converted to physical value

cc_val: mdfinfo4.info4 conversion block ('CCBlock') dict

Returns converted data to physical value

class mdf4reader.mdf4 (fileName=None, channelList=None, convertAfterRead=True, filterChannel-

Names=False, noDataLoading=False, compression=False)

Bases: mdf.mdf_skeleton

mdf file reader class from version 4.0 to 4.1.1

Attributes

fileName	(str) file name
MDFVer-	(int) mdf file version number
sionNum-	
ber	
master-	(dict) Represents data structure: a key per master channel with corresponding value
Channel-	containing a list of channels One key or master channel represents then a data group having
List	same sampling interval.
multiProc	(bool) Flag to request channel conversion multi processed for performance improvement.
	One thread per data group.
con-	(bool) flag to convert raw data to physical just after read
vertAfter-	
Read	
filterChan-	(bool) flag to filter long channel names from its module names separated by '.'
nelNames	
file_metadata	(dict) file metadata with minimum keys: author, organisation, project, subject, comment,
	time, date

Methods

read4(fileName=None, info=None, multiProc=False,	Reads mdf 4.x file data and stores it in dict
channelList=None, convertAfterRead=True)	
_getChannelData4(channelName)	Returns channel numpy array
_convertChannel4(channelName)	converts specific channel from raw to physical
	data according to CCBlock information
_convertAllChannel4()	Converts all channels from raw data to converted
	data according to CCBlock information

read4 (fileName=None, info=None, multiProc=False, channelList=None, convertAfterRead=True, filterChannelNames=False, compression=False)
Reads mdf 4.x file data and stores it in dict

Parameters fileName: str, optional

file name

info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

multiProc: bool

flag to activate multiprocessing of channel data conversion

channelList: list of str, optional

list of channel names to be read If you use channelList, reading might be much slower but it will save you memory. Can be used to read big files

convertAfterRead: bool, optional

flag to convert channel after read, True by default If you use convertAfterRead by setting it to false, all data from channels will be kept raw, no conversion applied. If many float are stored in file, you can gain from 3 to 4 times memory footprint To calculate value from channel, you can then use method .getChannelData()

compression: bool, optional

falg to activate data compression with blosc

write4 (fileName=None)

Writes simple mdf 4.1 file

Parameters fileName: str, optional

Name of file If file name is not input, written file name will be the one read with appended '_new' string before extension

Notes

All channels will be converted to physical data, so size might be bigger than original file

 $\verb|mdf4reader.rationalConv| (\textit{vect}, \textit{cc_val})$

apply rational conversion to data

Parameters vect: numpy 1D array

raw data to be converted to physical value

cc_val: mdfinfo4.info4 conversion block ('CCBlock') dict

```
Returns converted data to physical value
class mdf4reader.record (dataGroup, channelGroup)
     Bases: list
     Methods
     CANOpen
     CGrecordLength
     Flags
     MLSD
     VLSD
     VLSD_CG
     addChannel (info, channelNumber)
          add a channel in class
              Parameters info: mdfinfo4.info4 class
                  channelNumber: int
                    channel number in mdfinfo4.info4 class
     byte_aligned
     channelGroup
     channelNames
     dataGroup
     dataRecordName
     hiddenBytes
     invalid_channel
     loadInfo(info)
          gathers records related from info class
              Parameters info: mdfinfo4.info4 class
     master
     numberOfRecords
     numpyDataRecordFormat
     readBitarray (bita, info, channelSet=None)
          reads stream of record bytes using bitarray module needed for not byte aligned data
              Parameters bita: stream
                    stream of bytes
                 channelSet: set of str, optional
                    set of channel to read
              Returns rec: numpy recarray
                    contains a matrix of raw data in a recarray (attributes corresponding to channel name)
```

```
readRecordBuf (buf, info, channelSet=None)
           read stream of record bytes
               Parameters buf: stream
                     stream of bytes read in file
                   channelSet: set of str, optional
                     set of channel to read
               Returns rec: dict
                     returns dictionary of channel with its corresponding values
     readSortedRecord (fid, pointer, info, channelSet=None)
           reads record, only one channel group per datagroup
               Parameters fid: float
                     file identifier
                   pointer
                     position in file of data block beginning
                   channelSet: set of str, optional
                     set of channel to read
               Returns rec: numpy recarray
                     contains a matrix of raw data in a recarray (attributes corresponding to channel name)
           Notes
           If channelSet is None, read data using numpy.core.records.fromfile that is rather quick. However, in case
           of large file, you can use channelSet to load only interesting channels or only one channel on demand, but
           be aware it might be much slower.
     recordID
     recordIDCFormat
     recordIDsize
     recordLength
     recordToChannelMatching
mdf4reader.textToTextConv(vect, cc_ref)
     apply text to text conversion to data
           Parameters vect : numpy 1D array
                   raw data to be converted to physical value
               cc_ref: cc_ref from mdfinfo4.info4 conversion block ('CCBlock') dict
           Returns converted data to physical value
mdf4reader.textToValueConv(vect, cc_val, cc_ref)
     apply text to value conversion to data
           Parameters vect: numpy 1D array
```

raw data to be converted to physical value

```
cc_val : cc_val from mdfinfo4.info4 conversion block ('CCBlock') dict
               cc_ref: cc_ref from mdfinfo4.info4 conversion block ('CCBlock') dict
           Returns converted data to physical value
mdf4reader.valueRangeToTextConv(vect, cc_val, cc_ref)
     apply value range to text conversion to data
           Parameters vect: numpy 1D array
                   raw data to be converted to physical value
               cc_val: cc_val from mdfinfo4.info4 conversion block ('CCBlock') dict
               cc_ref : cc_ref from mdfinfo4.info4 conversion block ('CCBlock') dict
           Returns converted data to physical value
mdf4reader.valueRangeToValueTableConv(vect, cc_val)
     apply value range to value table conversion to data
           Parameters vect: numpy 1D array
                   raw data to be converted to physical value
               cc_val: mdfinfo4.info4 conversion block ('CCBlock') dict
           Returns converted data to physical value
mdf4reader.valueToTextConv(vect, cc val, cc ref)
     apply value to text conversion to data
           Parameters vect: numpy 1D array
                   raw data to be converted to physical value
               cc val: cc val from mdfinfo4.info4 conversion block ('CCBlock') dict
               cc_ref : cc_ref from mdfinfo4.info4 conversion block ('CCBlock') dict
           Returns converted data to physical value
mdf4reader.valueToValueTableWInterpConv(vect, cc_val)
     apply value to value table with interpolation conversion to data
           Parameters vect: numpy 1D array
                   raw data to be converted to physical value
               cc_val: mdfinfo4.info4 conversion block ('CCBlock') dict
           Returns converted data to physical value
mdf4reader.valueToValueTableWOInterpConv(vect, cc val)
     apply value to value table without interpolation conversion to data
           Parameters vect: numpy 1D array
                   raw data to be converted to physical value
               cc_val: mdfinfo4.info4 conversion block ('CCBlock') dict
           Returns converted data to physical value
```

MDFINFO4 MODULE DOCUMENTATION

Measured Data Format blocks paser for version 4.x

6.1 Platform and python version

With Unix and Windows for python 2.6+ and 3.2+

Created on Sun Dec 15 12:57:28 2013

Author Aymeric Rateau

6.2 Dependencies

- Python >2.6, >3.2 http://www.python.org
- Numpy >1.6 http://numpy.scipy.org

6.3 Attributes

PythonVersion [float] Python version currently running, needed for compatibility of both python 2.6+ and 3.2+

6.4 mdfinfo4 module

```
class mdfinfo4.ATBlock (fid, pointer)
```

Bases: dict

reads Attachment block and saves in class dict

Methods

class mdfinfo4.CABlock (fid, pointer)

Bases: dict

reads Channel Array block and saves in class dict

Methods

```
class mdfinfo4.CCBlock (fid=None, pointer=None)
     reads Channel Conversion block and saves in class dict
     Methods
     read (fid, pointer)
class mdfinfo4.CGBlock (fid=None, pointer=None)
     Bases: dict
     reads Channel Group block and saves in class dict
     Methods
     read (fid, pointer)
     write (fid, cg_cycle_count, cg_data_bytes)
class mdfinfo4.CHBlock (fid, pointer)
     Bases: dict
     reads Channel Hierarchy block and saves in class dict
     Methods
class mdfinfo4.CNBlock
     Bases: dict
     reads Channel block and saves in class dict
     Methods
     read (fid, pointer)
     write(fid)
class mdfinfo4.CommentBlock (fid=None, pointer=None, MDType=None)
     Bases: dict
     Methods
     extractXmlField(xml_tree, find)
          Extract Xml field from a xml tree
              Parameters xml_tree: xml tree from xml.etree.ElementTree
                  field : str
              Returns field value in xml tree
```

```
read (fid, pointer, MDType=None)
          reads Comment block and saves in class dict
          Notes
          Can read xml (MD metadata) or text (TX) comments from several kind of blocks
     write (fid, data, MDType)
class mdfinfo4.DGBlock (fid=None, pointer=None)
     Bases: dict
     reads Data Group block and saves in class dict
     Methods
     read (fid, pointer)
     write (fid)
class mdfinfo4.DLBlock (fid, link_count)
     Bases: dict
     reads Data List block
     Methods
class mdfinfo4.DZBlock (fid)
     Bases: dict
     reads Data List block
     Methods
class mdfinfo4.EVBlock (fid, pointer)
     Bases: dict
     reads Event block and saves in class dict
     Methods
class mdfinfo4.FHBlock (fid=None, pointer=None)
     Bases: dict
     reads File History block and save in class dict
     Methods
     read (fid, pointer)
     write (fid)
```

6.4. mdfinfo4 module 37

```
class mdfinfo4.HDBlock (fid=None, pointer=64)
     Bases: dict
     reads Header block and save in class dict
     Methods
     read (fid=None, pointer=64)
     write(fid)
class mdfinfo4.HLBlock (fid)
     Bases: dict
     reads Header List block
     Methods
class mdfinfo4.IDBlock (fid=None)
     Bases: dict
     reads or writes ID Block
     Methods
     read(fid)
          reads IDBlock
     write(fid)
          Writes IDBlock
class mdfinfo4.SIBlock
     Bases: dict
     reads Source Information block and saves in class dict
     Methods
     read (fid, pointer)
class mdfinfo4.SRBlock (fid, pointer)
     Bases: dict
     reads Sample Reduction block and saves in class dict
     Methods
mdfinfo4.elementTreeToDict (element)
     converts xml tree into dictionnary
          Parameters element: xml tree from xml.etree.ElementTree
          Returns dict of xml tree flattened
class mdfinfo4.info4 (fileName=None, fid=None, minimal=0)
     Bases: dict
```

Methods

```
cleanDGinfo(dg)
     delete CN,CC and CG blocks related to data group
         Parameters dg: int
               data group number
fid
fileName
listChannels4 (fileName=None, fid=None)
     Read MDF file and extract its complete structure
         Parameters fileName: str
               file name
         Returns list of channel names contained in file
readATBlock (selfself, fid, pointer)
     reads Attachment blocks
         Parameters fid: float
               file identifier
             pointer: int
               position of ATBlock in file
         Returns Attachments Blocks in a dict
readCGBlock (fid, dg, channelNameList=False, minimal=0)
     reads Channel Group blocks
         Parameters fid: float
               file identifier
             dg: int
               data group number
             channelNameList: bool
               Flag to reads only channel blocks for listChannels4 method
             minimal: falg
               to activate minimum content reading for raw data fetching
readCNBlock (fid, dg, cg, channelNameList=False, minimal=0)
     reads Channel blocks
         Parameters fid: float
               file identifier
             dg: int
               data group number
             cg: int
               channel group number in data group
```

6.4. mdfinfo4 module 39

```
channelNameList: bool
               Flag to reads only channel blocks for listChannels4 method
             minimal: falg
               to activate minimum content reading for raw data fetching
readComposition (fid, dg, cg, MLSDChannels, channelNameList=False)
     check for composition of channels, arrays or structures
         Parameters fid: float
                file identifier
             dg: int
               data group number
             cg: int
               channel group number in data group
             MLSDChannels: list of int
               channel numbers
             channelNameList: bool
               Flag to reads only channel blocks for listChannels4 method
         Returns MLSDChannels list of appended Maximum Length Sampling Data channels
readDGBlock (fid, channelNameList=False, minimal=0)
     reads Data Group Blocks
         Parameters fid: float
               file identifier
             channelNameList: bool
               Flag to reads only channel blocks for listChannels4 method
             minimal: falg
               to activate minimum content reading for raw data fetching
readSRBlock (fid, pointer)
     reads Sample Reduction Blocks
         Parameters fid: float
               file identifier
             pointer: int
               position of SRBlock in file
         Returns Sample Reduction Blocks in a dict
readinfo(fid, minimal)
     read all file blocks except data
         Parameters fid: float
               file identifier
             minimal: falg
```

to activate minimum content reading for raw data fetching

6.4. mdfinfo4 module 41

CHAPTER

SEVEN

CHANNEL MODULE DOCUMENTATION

Measured Data Format file reader module.

7.1 Platform and python version

With Unix and Windows for python 2.7 and 3.4+

Author Aymeric Rateau

Created on Wed Oct 04 21:13:28 2017

7.2 Dependencies

- Python >2.6, >3.4 http://www.python.org
- Numpy >1.6 http://numpy.scipy.org

7.3 Attributes

PythonVersion [float] Python version currently running, needed for compatibility of both python 2.6+ and 3.4+

7.4 channel module

class channel. Channel3 (info, dataGroup, channelGroup, channelNumber, recordIDnumber)

Channel class gathers all about channel structure in a record

Attributes

name	(str) Name of channel
unit	(str, default empty string) channel unit
desc	(str) channel description
conversion	(info class) conversion dictionnary
channelNumber	(int) channel number corresponding to mdfinfo3.info3 class
signalDataType	(int) signal type according to specification
bitCount	(int) number of bits used to store channel record
nBytes	(int) number of bytes (1 byte = 8 bits) taken by channel record
dataFormat	(str) numpy dtype as string
CFormat	(struct class instance) struct instance to convert from C Format
byteOffset	(int) position of channel record in complete record in bytes
bitOffset	(int) bit position of channel value inside byte in case of channel having bit count below
	8
recAttribute-	(str) channel name compliant to a valid python identifier (recarray attribute)
Name	
RecordFormat	(list of str) dtype format used for numpy.core.records functions
	((name_title,name),str_stype)
channelType	(int) channel type
posByteBeg	(int) start position in number of bit of channel record in complete record
posByteEnd	(int) end position in number of bit of channel record in complete record
CFormat byteOffset bitOffset recAttribute- Name RecordFormat channelType posByteBeg	(struct class instance) struct instance to convert from C Format (int) position of channel record in complete record in bytes (int) bit position of channel value inside byte in case of channel having bit count below 8 (str) channel name compliant to a valid python identifier (recarray attribute) (list of str) dtype format used for numpy.core.records functions ((name_title,name),str_stype) (int) channel type (int) start position in number of bit of channel record in complete record

Methods

init(info, dataGroup, channelGroup, channelNumber, recordIDnumber	r) constructor
str()	to print class attributes

changeChannelName (channelGroup)

In case of duplicate channel names within several channel groups for unsorted data, rename channel name

Parameters channelGroup: int

channelGroup bumber

channel.arrayformat4 (signalDataType, numberOfBits)

function returning numpy style string from channel data type and number of bits

Parameters signalDataType: int

channel data type according to specification

numberOfBits: int

number of bits taken by channel data in a record

Returns dataType: str

numpy dtype format used by numpy.core.records to read channel raw data

class channel.channel4

Bases: object

Methods

```
{\bf CABlock}\ (info)
```

Extracts channel CA Block from info4

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns CABlock object from mdfinfo4 module

CANOpenOffset (info)

CANopen channel bytes offset

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns integer, channel bytes offset

CFormat (info)

channel data C format struct object

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns string data C format struct object

CNBlock (info)

channel block

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns CNBlock class from mdfinfo4 module

Format (info)

channel data C format

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns string data C format

RecordFormat (info, recAttributeName=None)

recarray dtype string

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns recarray dtype

VLSD_CG_Flag

attachment (fid, info)

In case of sync channel attached to channel

Parameters fid: class

file identifier

info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

```
Returns ATBlock class from mdfinfo4 module
bitCount (info)
     calculates channel number of bits
         Parameters info: mdfinfo4.info4 class
               info4 class containing all MDF Blocks
         Returns integer corresponding to channel number of bits
bitOffset (info)
     channel data bit offset in record
         Parameters info: mdfinfo4.info4 class
               info4 class containing all MDF Blocks
         Returns integer, channel bit offset
byteOffset (info)
     channel data bytes offset in record (without record id)
         Parameters info: mdfinfo4.info4 class
               info4 class containing all MDF Blocks
         Returns integer, channel bytes offset
changeChannelName (channelGroup)
     In case of duplicate channel names within several channel groups for unsorted data, rename channel name
         Parameters channelGroup: int
               channelGroup bumber
channelGroup
channelNumber
channelSyncType (info)
     Extracts channel sync type from info4
         Parameters info: mdfinfo4.info4 class
               info4 class containing all MDF Blocks
         Returns integer corresponding to channel sync type
             0 no sync, normal data
             1 time
             2 angle
             3 distance
             4 index
channelType (info)
     Extracts channel type from info4
         Parameters info: mdfinfo4.info4 class
               info4 class containing all MDF Blocks
```

```
Returns integer describing channel type
0 normal channel
1 variable length
```

2 master channel

3 virtual master channel

4 sync channel

5 max length data

6 virtual data channel

conversion (info)

channel conversion CCBlock

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns CCBlock

data(info)

returns data block pointer for VLSD, MLD or sync channels

dataFormat (info)

channel numpy.core.records data format

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns string data format

dataGroup

desc(info)

channel description

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns channel description string

invalid_bit (info)

extrzcts from info4 the channels valid bits positions

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns dict of channels valid bits positions

little_endian(info)

check if channel is little endian

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns boolean

nBytes (info)

calculates channel bytes number

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns number of bytes integer

name

nativeRecordFormat (info)

channel numpy.core.records data format without endian (< or >)

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns string data format

posBitBeg(info)

channel data bit starting position in record

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns integer, channel bit starting position

posBitEnd(info)

channel data bit ending position in record

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns integer, channel bit ending position

posByteBeg(info)

channel data bytes starting position in record

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns integer, channel bytes starting position

posByteEnd(info)

channel data bytes ending position in record

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns integer, channel bytes ending position

recAttributeName (info)

clean up channel name from unauthorised characters

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns channel name compliant to python attributes names (for recarray)

recordIDsize (info)

Extracts record id size from info4

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

```
Returns integer describing record id size
             0 no record id used
             1 mint8
             2 uint16
             4 uint32
             8 uint64
set (info, dataGroup, channelGroup, channelNumber)
     channel initialisation
         Parameters info: mdfinfo4.info4 class
             dataGroup: int
               data group number in mdfinfo4.info4 class
             channelGroup: int
               channel group number in mdfinfo4.info4 class
             channelNumber: int
               channel number in mdfinfo4.info4 class
             recordIDsize: int
               size of record ID in Bytes
setCANOpen (info, dataGroup, channelGroup, channelNumber, name)
     CANOpen channel intialisation
         Parameters info: mdfinfo4.info4 class
             dataGroup: int
               data group number in mdfinfo4.info4 class
             channelGroup: int
               channel group number in mdfinfo4.info4 class
             channelNumber: int
               channel number in mdfinfo4.info4 class
             recordIDsize: int
               size of record ID in Bytes
             name: str
               name of channel. Should be in ('ms', 'day', 'days', 'hour', 'month', 'minute', 'year')
setInvalidBytes (info, dataGroup, channelGroup, channelNumber)
     invalid_bytes channel initialisation
         Parameters info: mdfinfo4.info4 class
             dataGroup: int
               data group number in mdfinfo4.info4 class
             channelGroup: int
               channel group number in mdfinfo4.info4 class
```

```
channelNumber: int
```

channel number in mdfinfo4.info4 class

recordIDsize: int

size of record ID in Bytes

byte_aligned: Bool

Flag for byte alignement

signalDataType (info, byte_aligned=True)

extract signal data type from info4 class

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

byte_aligned: bool

flag activated if channel is part of a record byte aligned

Returns integer corresponding to channel data type

0 unsigned integer little endian

- 1 unsigned integer big endian
- 2 signed integer little endian
- 3 signed integer big endian
- 4 float little endian
- 5 float big endian
- 6 string latin
- 7 string utf-8
- 9 string utf-16
- 10 byte array
- 11 mime sample
- 12 mime stream
- 13 CANopen date
- 14 CANopen time

type

unit (info)

channel unit

Parameters info: mdfinfo4.info4 class

info4 class containing all MDF Blocks

Returns channel unit string

validity_channel (info, invalid_bytes)

extract channel validity bits

Parameters info: mdfinfo4.info4 class

invalid_bytes: bytes

bytes from where to extract validity bit array

channel.datatypeformat4 (signalDataType, numberOfBits)

function returning C format string from channel data type and number of bits

Parameters signalDataType : int

channel data type according to specification

numberOfBits: int

number of bits taken by channel data in a record

Returns dataType: str

C format used by fread to read channel raw data
